I met with LDEQ yesterday at the Delta Shipyard site in Houma, Louisiana-The state has asked us to re-evaluate this site for EPA action. Since EPA's last visit (1998) two homes have been built on adjoining land to the former pit area. In addition the pits have not been remediated and based on the 1996 sampling contain high levels of hazardous substances-- I have included the 1996 ESI and the SSSR that documents our decision-which was in 1998 to perform an EE/CA under removal. This site has an ERS exclusion in CERCLIS which denotes it as a site that is not eligible for Brownfields-and this exclusion is typically used only on NPL caliber sites and or OCA sites. The state feels strongly that this site needs to be stabilized to prevent future exposures. I believe they would like to find a way to stabilize the pits in-situ if possible. I would like to have a team meeting to discuss next steps for this site, including enforcement options. I have included the pdfs-an aerial of the pit from Google earth and a few google links. Please let me know who from each group will be on the site team.
